Conclusion of current search for Malaysian Airlines flight MH370

During the course of its operation, Ocean Infinity searched and collected high quality data from over 112,000 km² of ocean floor successfully overcoming both challenging conditions and terrain. The total area covered, in a little over 3 months of operational days, is far in excess of the initial 25,000 km² target and almost the same area as the previous search achieved in 2 ½ years.

Oliver Plunkett, Ocean Infinity's CEO, said:

"I would firstly like to extend the thoughts of everyone at Ocean Infinity to the families of those who have lost loved ones on MH370. Part of our motivation for renewing the search was to try to provide some answers to those affected. It is therefore with a heavy heart that we end our current search without having achieved that aim.

We are most grateful to the Government of Malaysia for entertaining our offer and affording us the opportunity to recommence the search. The commitment that the new government in Malaysia has made to prioritising finding MH370 was very good to hear.

We want to thank the team onboard Seabed Constructor who have worked tirelessly and all the many companies, organizations and individuals whose support, guidance and advice were invaluable. The staff at the ATSB whose dedication to finding the plane has been unwavering deserve our particular gratitude.

Whilst clearly the outcome so far is extremely disappointing, as a company, we are truly proud of what we have achieved both in terms of the quality of data we've produced and the speed with which we covered such a vast area. There simply has not been a subsea search on this scale carried out as efficiently or as effectively ever before.

We sincerely hope that we will be able to again offer our services in the search for MH370 in future."
